

Oh no!

I deleted/formatted/lost/destroyed that flash drive that contains Lubuntu!

## How to do it

### You will need:

- Any flash drive (doesn't matter what's on it as it will be overwritten)
- The ISO file located at <http://cdimage.ubuntu.com/lubuntu/releases/18.04/release/lubuntu-18.04.1-iso.iso>
  - This is the Lubuntu CD image. It is what is booted off of.
- The program, Rufus, located at `tools\rufus-3.1.exe`.
  - This is the program which copies the ISO file over to the flash drive.

### Ok, now how do I do it?

1. Plug in the flash drive.
2. Run Rufus.
3. Under **Device**, select the drive letter that corresponds to the flash drive you plugged in.
4. Under **Boot selection**, click on the **SELECT** button and select the ISO file that you want the flash drive to have.
5. Click on **Start**.
6. If it asks you to download required files, click **Yes**.
7. It will tell you that an ISOHybrid image is detected.

It will prompt you to either:

- Write in ISO mode,
- Write in dd mode.

Select dd mode for maximum compatability.

8. You're done! Check that it boots.
