

## Where can I whitelist new domains?

You can find the domains whitelisted under the `/etc/privoxy/opac.action` file.

PROTIP:

1. Open terminal with CTRL-ALT-T.
2. Type in `sudo pcmanfm /etc/privoxy` to open pcmanfm to the Privoxy configuration directory.
  - a. Alternatively, `sudo nano /etc/privoxy/opac.action` will do the trick.

## Cool, how do I do it?

If simply viewing the file doesn't answer this question, please go to <https://www.privoxy.org/user-manual/actions-file.html>

You just add the site below the `{ -block }` section, like so:

```
...  
{ -block }  
  
www.kongregate.com  
www.abcgames.com  
  
...
```

etc.

Section 8.4 details the 'patterns' that you can use.

## Why does X pattern exist? What's with the asterisks/\*s?

`*.google.com` is a pattern that allows `maps.google.com`, `docs.google.com`, etc.

This is why you see `*.clamsnet.org`, because the pattern `clamsnet.org` does NOT cover:

- `encore.clamsnet.org`
- `library.clamsnet.org`
- `info.clamsnet.org`

Anyways, have fun blocking!
